Query example IUM-TWEB

Bissal Youssef, Lombardozzi Christian

Now we will display some query to show that the web-app works properly. The Operations we are going to see are composed of several queries, grouped like a "User Journey", a typical operation that a user can do.

1) Navigate from the Home Page, exploring.

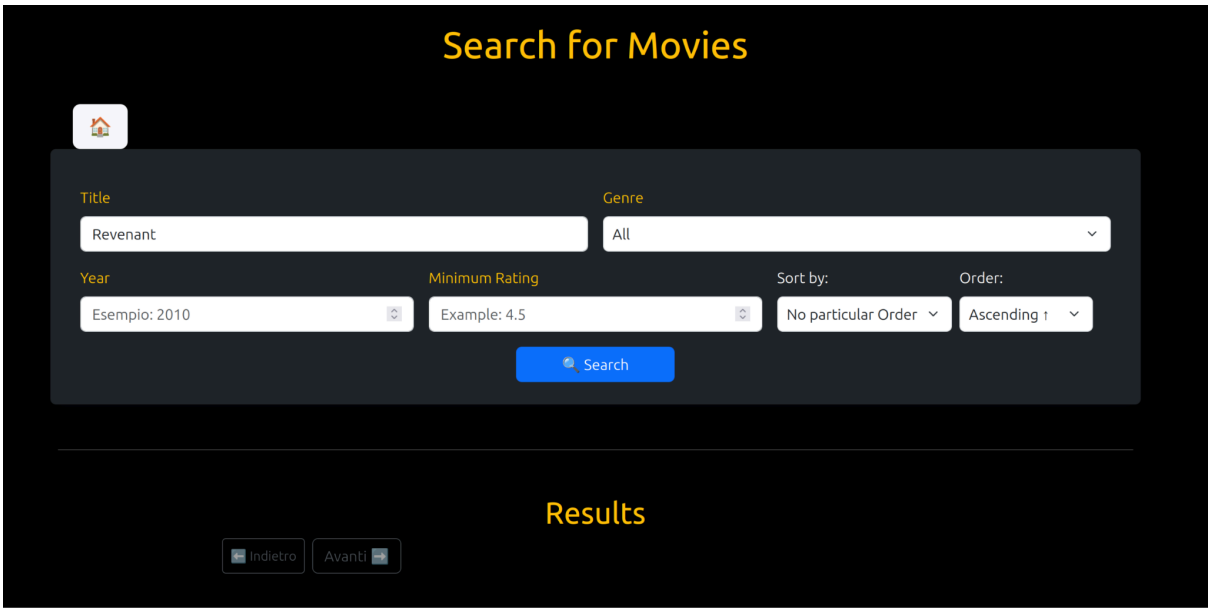

Here we can already see some results, for example the first five movies by rating , some suggestions… Now we can click on a card of a movie to see his details:

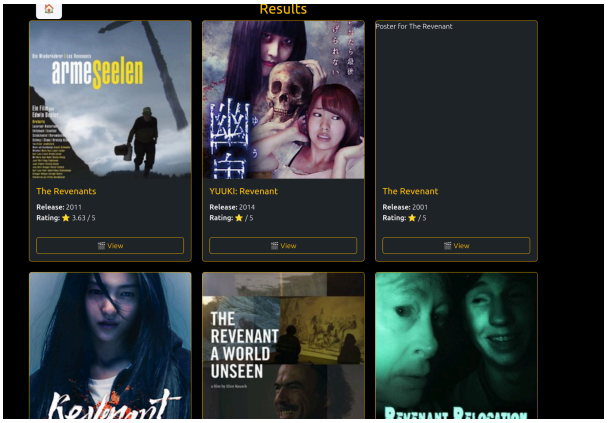

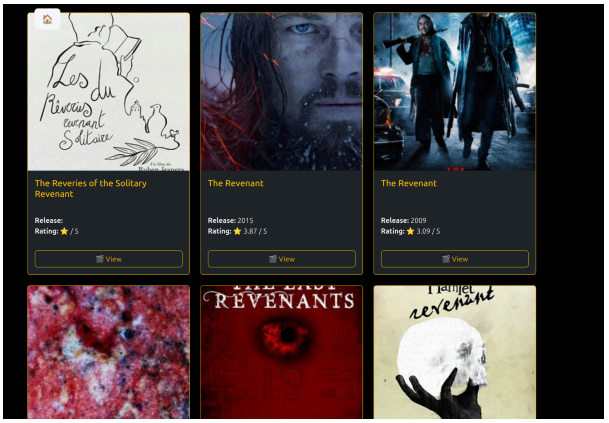

Here we have the movie page dedicated with extended details. There is even a sticky Home page button, so the users, even if they scroll down the page, can always return to the Home Page as soon as they want.

2) Search for movies that contain "Revenant" in their name.

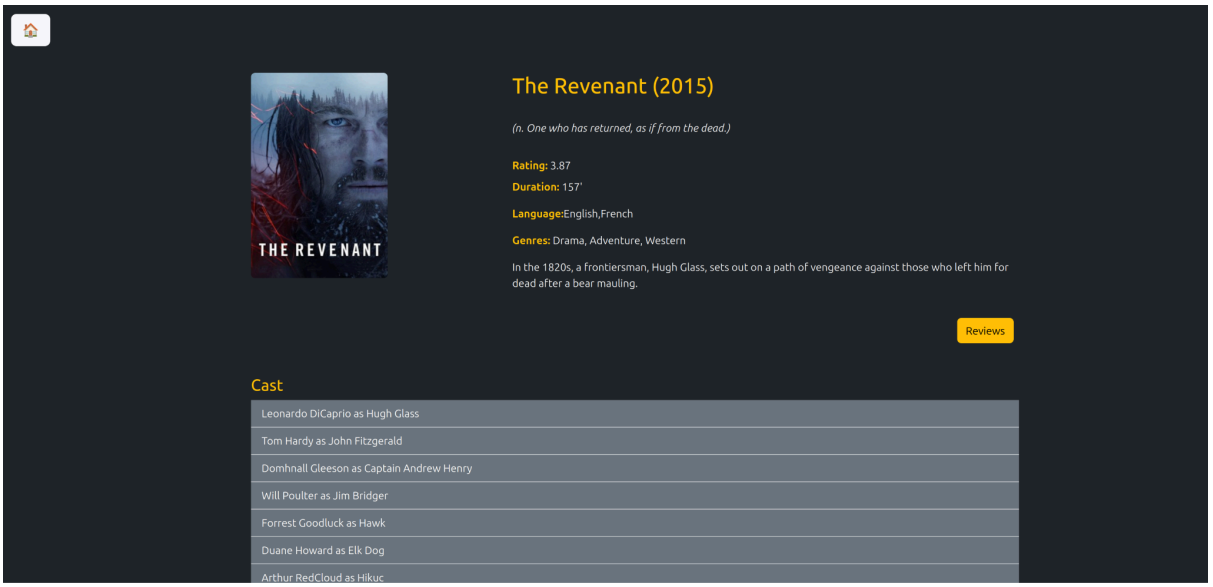

Display the results:

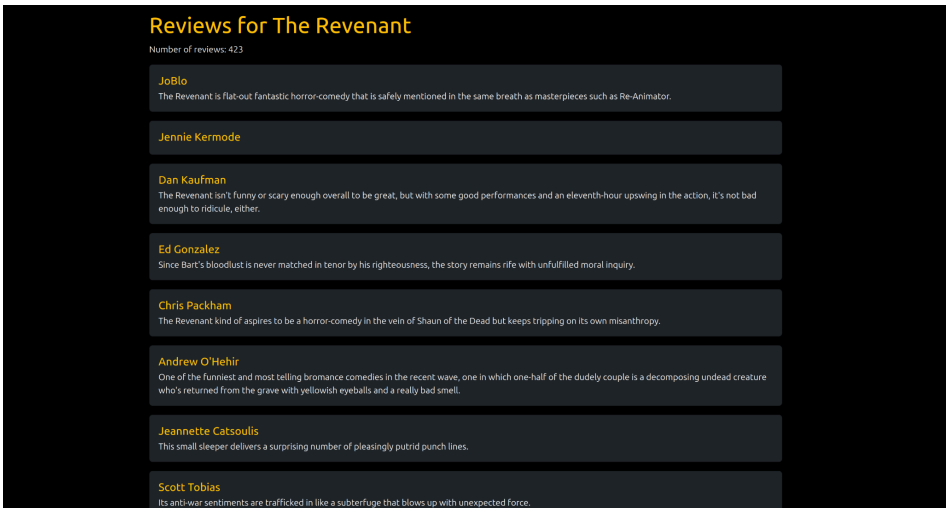

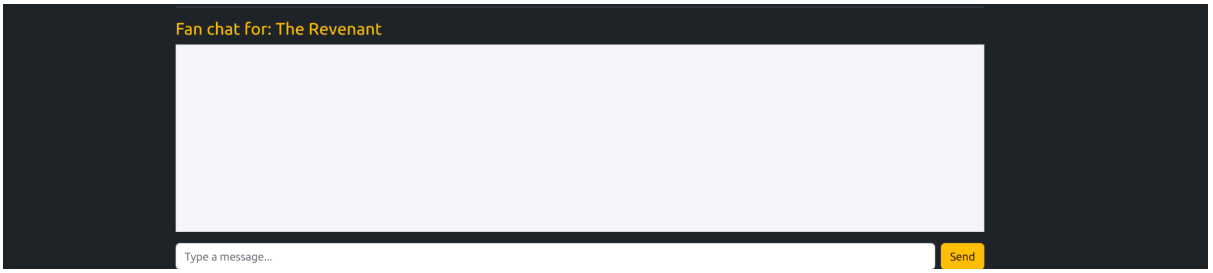

Now let’s explore the details of the movie “The Revenant” with Leonardo Di Caprio, by clicking the “view” button:

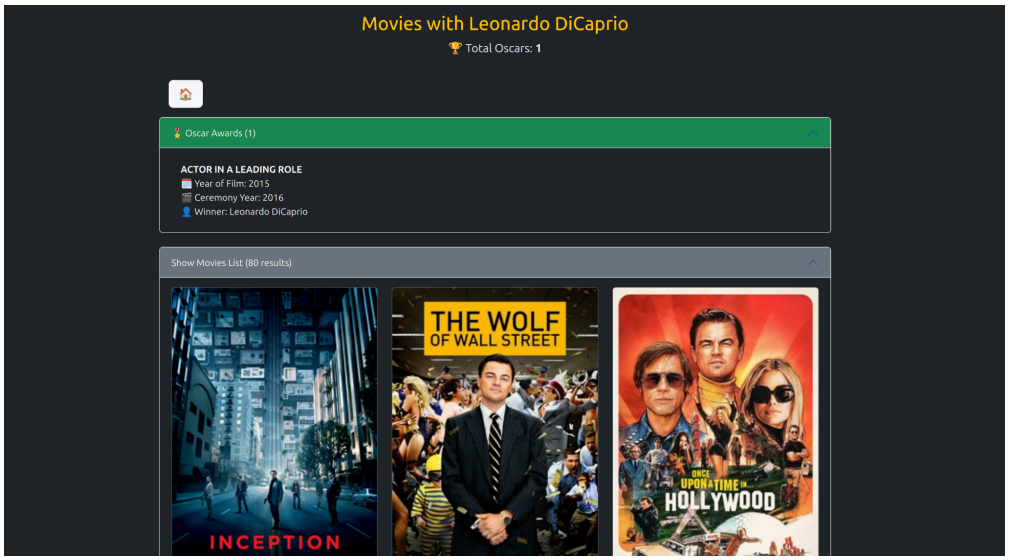

We can click on the button “Reviews” see others thought about the movie:

There is also a instant chat for fans and journalist:

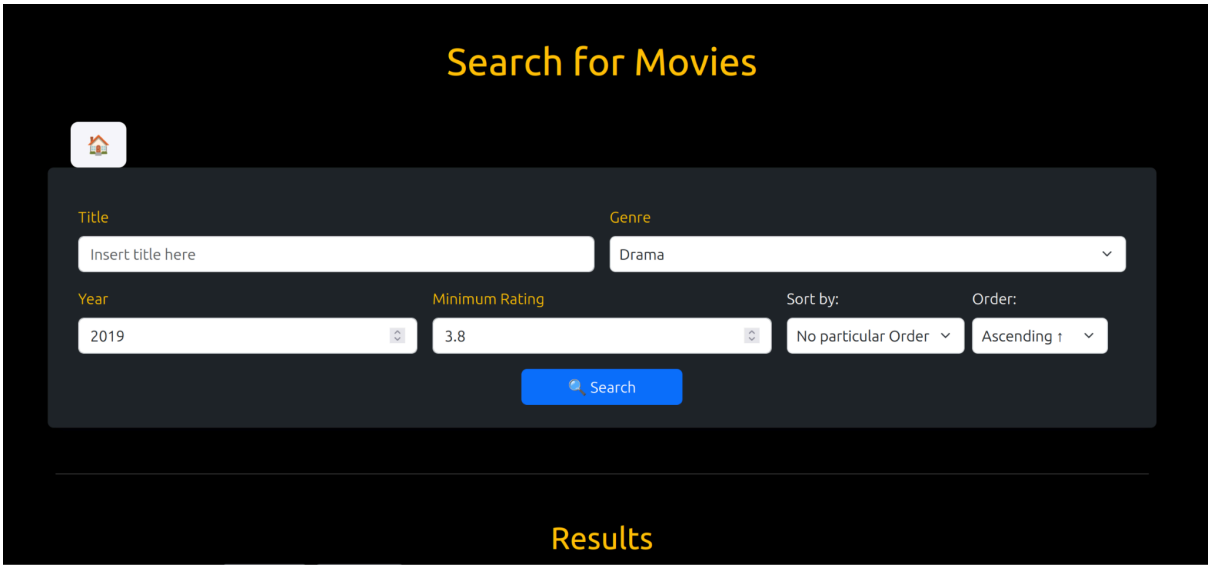

Now by clicking on a name of a member of the cast, we will be redirected to a Actor dedicated page, for example click on "Leonardo Di Caprio":

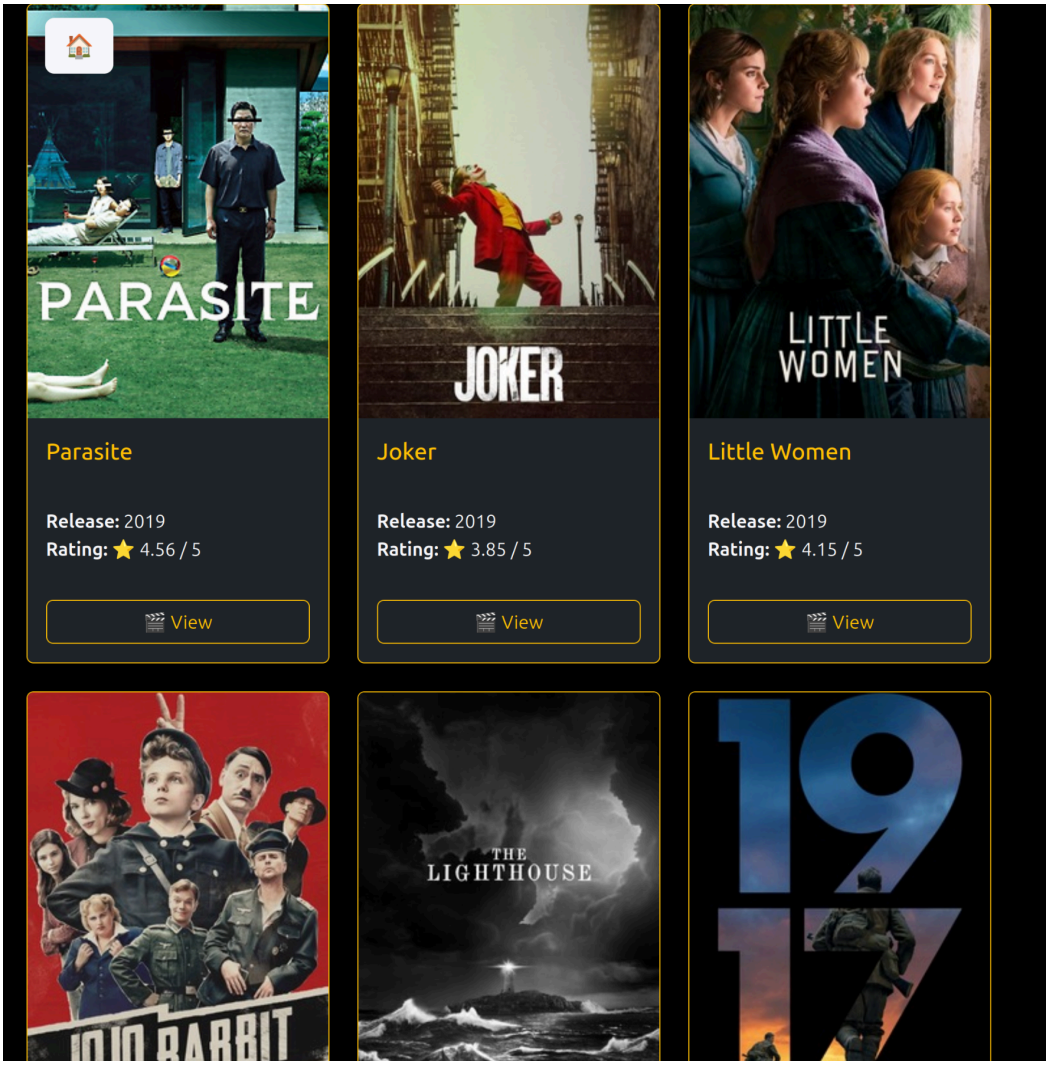

This page will show us the awards if present, and the other movies with the actor/actress selected.

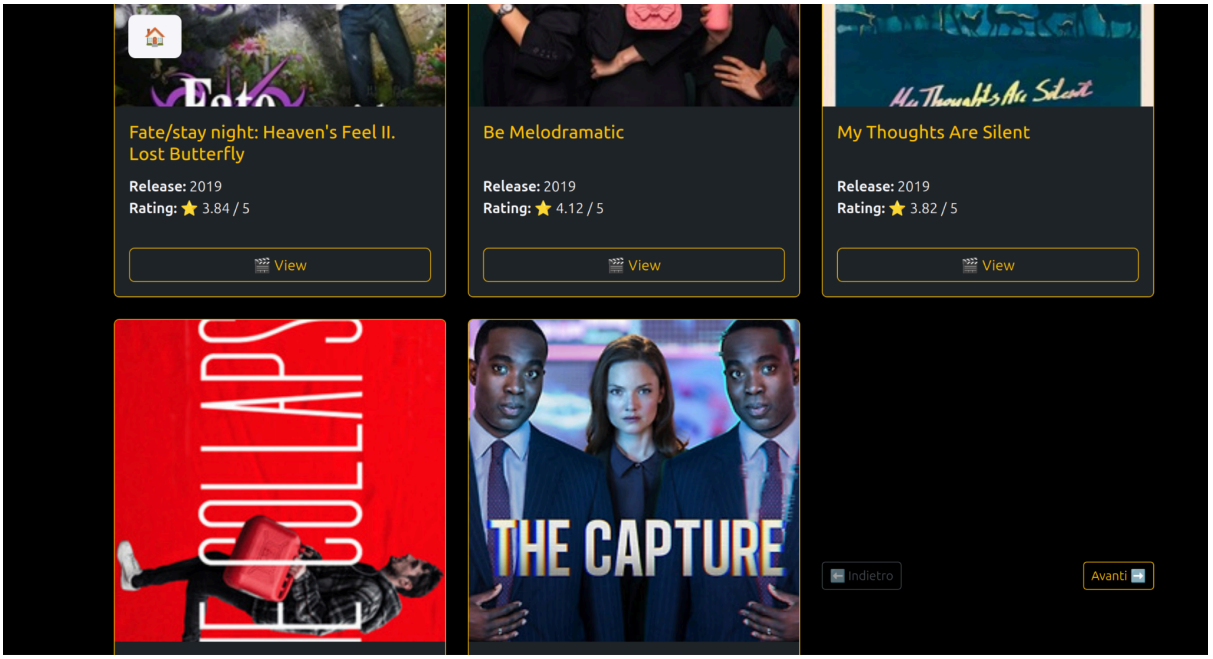

3)Now we will search for movies of 2019, with minimum rating of 3.8 and genre "Drama".

Here the results (we reduce the page to show its adaptability):

Scrolling to the end of the page we will find Button to navigate for further results:

This helps the users by giving them a small portion of the results at a time, and it eases the work for the servers.
